THE ALABAMA DEPARTMENT OF AGRICULTURE, THE FLORIDA STATE MARKETING BUREAU,
THE GEORGIA DEPARTMENT OF AGRICULTURE, THE MISSISSIPPI DEPARTMENT OF AGRICULTURE AND COMMERCE,
AND THE SOUTH CAROLINA STATE AGRICULTURAL MARKETING COMMISSION

Cooperating

FOREWORD.

The information in this summary was compiled from the semi-weekly reports issued at Albany, Georgia from October 28 to December 23, 1958. Data for these reports were collected in Georgia, Florida, Alabama and Mississippi by the local reporter with the aid of Mr. Wann of the Dairy Market News office in Jackson and Mr. Morgan of the Fruit & Vegetable Market News office in Birmingham. Mr. Hopkins of the Columbia Market News office collected the data from South Carolina. The information for the market reports was assembled by the local representative in Albany and relayed to the Market News office in Atlanta by telephone, where the reports were published and mailed. Information from Texas, Louisiana, Oklahoma, Chicago and New York city was sent over the teletype direct to the Atlanta office.

The local representative at Albany wishes to thank those who were so cooperative in furnishing information for the reports during the 1958 season. These include growers, buyers, dealers, auction managers and market reporters in Columbia, Jackson, Birmingham, Chicago, New York city, Texas, Oklahoma and Louisiana.

The semi-weekly pecan report was financed cooperatively by the United States Department of Agriculture, Agricultural Marketing Service, and the Alabama Department of Agriculture, the Florida State Marketing Bureau, the Georgia Department of Agriculture, the Mississippi Department of Agriculture and Commerce, and the South Carolina State Agricultural Marketing Commission.

Additional copies of this summary may be secured by writing to the United States Department of Agriculture, Agricultural Marketing Service, Market News Branch, Fruit and Vegetable Division, Washington 25, D. C.

Issued at Sanford, Florida, March 1959.

REVIEW OF THE 1958 PECAN MARKETING SEASON.

Market reports were issued semi-weekly on pecans at Albany, Georgia from October 28th through December 23rd, 1958. These reports were issued by the Market News Branch, Fruit and Vegetable Division of the United States Department of Agriculture in cooperation with the Alabama Department of Agriculture, the Florida State Marketing Bureau, the Georgia Department of Agriculture, the Mississippi Department of Agroculture and Commerce and the South Carolina State Marketing Commission.

The Crop Reporting Board of the United States Department of Agriculture in its December report, estimated that the 1958 pecan crop would total 162,100,000 pounds. The production in 1957 was 141,350,000 pounds and the average during the 10 year period 1947-1956 was 148,377,000 pounds. The production of improved varieties was estimated to be above the average crop and more than double last year's small crop. The wild and seedling crop was estimated to be slightly below the average and less than 75% of last year's production.

The pecan crop was generally spotty on all states. In Florida, eastward from Monticello the crop was very light. In Georgia, some sections had a good crop, while a short distance away the crop was very light. In Alabama and Mississippi there was a heavy set of pecans along the Gulf coast, but in other sections of those states the crop was irregular. In South Carolina the crop was about normal. Severe damage was done by Hurricane Helene in seven counties of southeastern North Carolina. In the states west of the Mississippi river, Louisiana was the only one that had a near normal crop. In some counties in Oklahoma the crop was almost a failure due to rainy weather when the trees were in blossom. The five states, Alabama, Florida, Georgia, Mississippi and South Carolina, which cooperated in issuing the reports from Albany, produced more than 50% of the entire 1958 crop and approximately 78% of all improved varieties. Georgia is the largest producer of improved varieties, followed by Alabama. It is estimated that these two states produced approximately 60% of all improved varieties grown in 1958 and nearly 40% of the entire crop. Arkansas, Louisiana, Oklahoma and Texas produce the bulk of the wild and seedling varieties. The estimated production of these varieties this season in those four states was approximately 40,000,000 pounds less than last year's heavy production, and about 4,000,000 pounds below the average during the period 1947-1956.

1958 MARKETING SEASON(Continued)

The quality of the 1958 pecan crop was irregular. In Georgia most Stuarts were of very good quality although a few were poor. Schleys were generally of poor quality in all states and the crop was very light. Success were generally of good quality. Other improved varieties showed a wide range in quality. Seedlings were generally of good quality in all states, although late in the season some were of light weight. Along the Gulf coast in Alabama and Mississippi the quality of improved varieties, early in the season, was poor to fair but improved later in the season. In Florida Stuarts were generally of fair quality. The quality of the South Carolina crop was about normal.

On account of the estimate of a crop considerable above normal, prices at the beginning of the season proved to be the lowest of the season. Throughout much of the season there was a good demand from truckers, and many growers found ready sales for their pecans at the orchard as soon as they were harvested. Although most shellers and processors bought only enough for their immediate needs early in the season, prices began to rise shortly after harvesting was under way and continued to rise steadily until around Thanksgiving, when there was a slight decline in price. Early in December the market strengthened again and held steady through December 23rd, when the last report was issued. The last auction held at Cordele, Georgia on January 8th, 1959, showed little change in prices of good pecans compared with the last previous auction held on December 18th.

*ALMONDS: The 1958 crop of almonds in California is estimated at 20,000 tons, 47% smaller than last year and approximately half of the 10 year average. The crop turned out to be the smallest since 1941. A poor set of nuts and a heavy drop was attributed to excessive rainfall during pollination and to a heavy infestation of fungus diseases.

*FILBERTS: Production of filberts in Oregon and Washington is estimated at 7,150 tons, 43% below last year and 5% below average. The 1958 crop had more blanks than a year earlier, apparently as a result of Brown-stain. A high percentage of the crop graded Large which meant fewer Jumbo and Medium sizes. Weather was ideal for harvesting the crop.

*WALNUTS: The 1948 crop of walnuts in California and Oregon totaled 84,500 tons, 27% greater than in 1957 and 15% above average. The crop was the largest since 1949. California growers had a good crop in nearly all Districts with sizes and grades above average. HOT WEATHER caused some sunburn but did not affect the tonnage. Sizes wore larger than usual. Oregon also had considerable sunburn and there was a fairly heavy drop of damaged nuts. Oregon nuts have thin shells this year, but sizes were smaller than usual.

* From the 1958 annual summary of the U. S. D. A. Crop Reporting Board.
